3.1.1. Numpy Array Operations

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using ndim
- The shape of the array using shape
- The total number of elements in the array using size

Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, and , representing the number of rows and the number of columns.
- The next lines contain space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array.

Note: Use reshape() function to reshape the input array with the specified number of rows and columns.

Code:

```
import numpy as np

r, c = map(int, input().split())

elements = []

for _ in range(r):
```

```

elements.extend(list(map(int, input().split()))))

arr = np.array(elements).reshape(r, c)

print(arr)

print(arr.ndim)

print(arr.shape)

print(arr.size)

```

Output:

Lab Assignment

3.2.1. Numpy: Matrix Operations

The given code takes two 3X3 matrices, matrix a and matrix b as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. **Addition ()**
2. **Subtraction ()**
3. **Element-wise Multiplication ()**
4. **Matrix Multiplication ()**
5. **Transpose of Matrix A**

Input Format:

- The user will input 3 rows for , each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for , each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The Transpose of Matrix A

Code:

```
import numpy as np

# Input matrices

print("Enter Matrix A:")

matrix_a = np.array([list(map(int, input().split())) for i in range(3)])

print("Enter Matrix B:")

matrix_b = np.array([list(map(int, input().split())) for i in range(3)])

# Addition

addition_result = matrix_a + matrix_b

print("Addition (A + B):")

print(addition_result)

# Subtraction

subtraction_result = matrix_a - matrix_b

print("Subtraction (A - B):")

print(subtraction_result)

# Multiplication (element-wise)

elementwise_multiplication_result = matrix_a * matrix_b

print("Element-wise Multiplication (A * B):")

print(elementwise_multiplication_result)

# Matrix multiplication (dot product)

matrix_multiplication_result=np.dot(matrix_a,matrix_b)

print("A dot B:")

print(matrix_multiplication_result)

# Transpose

transpose_a=matrix_a.T

print("Transpose of A:")

print(transpose_a)
```

Output:

3.2.2. Numpy: Horizontal and Vertical Stacking of Arrays

You are given two arrays arr1 and arr2. You need to perform horizontal and vertical stacking operations on them using NumPy.

- **Horizontal Stacking:** Stack the two matrices horizontally (side by side).
- **Vertical Stacking:** Stack the two matrices vertically (one below the other).

Input Format:

- The program should first prompt the user to input two 3x3 arrays.
- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

Output Format:

- The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.
- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

Code:

```
import numpy as np

# Input matrices

print("Enter Array1:")

arr1 = np.array([list(map(int, input().split())) for i in range(3)])

print("Enter Array2:")

arr2 = np.array([list(map(int, input().split())) for i in range(3)])

# Perform horizontal stacking (hstack)

a=np.hstack((arr1,arr2))

print("Horizontal Stack:")

print(a)

# Perform vertical stacking (vstack)

b = np.vstack((arr1,arr2))

print("Vertical Stack:")

print(b)
```

3.2.3. Numpy: Custom Sequence Generation

Write a Python program that takes the following inputs from the user:

- Start value: The starting point of the sequence.
- Stop value: The sequence should end before this value.
- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

Code:

```
import numpy as np

# Take user input for the start, stop, and step of the sequence

start = int(input())
```

```

stop = int(input())

step = int(input())

# Generate the sequence using np.arange()

a = np.arange(start,stop, step)

print(a)

```

Output:

3.2.4. Numpy: Arithmetic and Statistical Operations, Mathematical Operations, Bitwise Operators

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: $A_i \text{ OR } B_i$).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

Code:

```
import numpy as np

def array_operations(A, B):

    # Convert A and B to NumPy arrays
    A = np.array(A)
    B = np.array(B)

    # Arithmetic Operations
    sum_result = A+B
    diff_result = A-B
    prod_result = A*B

    # Statistical Operations
    mean_A = np.mean(A)
    median_A = np.median(A)
    std_dev_A = np.std(A)

    # Bitwise Operations
    and_result = A & B
    or_result = A | B
    xor_result = A ^ B

    # Output results with one space between each element
    print("Element-wise Sum:", ' '.join(map(str, sum_result)))
    print("Element-wise Difference:", ' '.join(map(str, diff_result)))
    print("Element-wise Product:", ' '.join(map(str, prod_result)))

    print(f"Mean of A: {mean_A}")
    print(f"Median of A: {median_A}")
    print(f"Standard Deviation of A: {std_dev_A}")
```

```
print("Bitwise AND:", ' '.join(map(str, and_result)))

print("Bitwise OR:", ' '.join(map(str, or_result)))

print("Bitwise XOR:", ' '.join(map(str, xor_result)))
```

A = list(map(int, input().split())) # Elements of array A

B = list(map(int, input().split())) # Elements of array B

array_operations(A, B)

Output:

3.2.5. Numpy: Copying and Viewing Arrays

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the original_array and assigning it to view_array.
- Creating a copy of the original_array and assigning it to copy_array.

After completing these steps, observe how modifying the view affects the original_array, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:

Original array after modifying view: <original_array>

View array: <view_array>

- After modifying the copy:

Original array after modifying copy: <original_array>

Copy array: <copy_array>

Code:

```
import numpy as np

inputlist = list(map(int,input().split(" ")))

# Original array
original_array = np.array(inputlist)

# Create a view
view_array = original_array.view()

# Create a copy
copy_array = original_array.copy()

# Modify the view
view_array[0] = 99

print("Original array after modifying view:", original_array)

print("View array:", view_array)

# Modify the copy
copy_array[1] = 88

print("Original array after modifying copy:", original_array)

print("Copy array:", copy_array)
```

3.2.6. Numpy: Searching, Sorting, Counting, Broadcasting

The given code in the editor takes a single array, array1, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- search_value: The value to search for in the array.
- count_value: The value to count its occurrences in the array.
- broadcast_value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. **Searching:** Find the indices where search_value appears in array1 and print these indices.
2. **Counting:** Count how many times count_value appears in array1 and print the count.
3. **Broadcasting:** Add broadcast_value to each element of array1 using broadcasting, and print the resulting array.
4. **Sorting:** Sort array1 in ascending order and print the sorted array.

Input Format:

1. A single line containing space-separated integers representing array1.
2. An integer search_value represents the value to search for in the array.

3. An integer count_value represents the value to count in the array.
4. An integer broadcast_value represents the value to add to each element of the array.

Output Format:

1. The indices where search_value occurs in array1.
2. The count of occurrences of count_value in array1.
3. The array after adding the broadcast_value to each element.
4. The sorted array.

Code:

```
import numpy as np

# Input array from the user
array1 = np.array(list(map(int, input().split()))))

# Searching
search_value = int(input("Value to search: "))
count_value = int(input("Value to count: "))
broadcast_value = int(input("Value to add: "))

# Find indices where value matches in array1
print(np.where(array1 == search_value)[0])

# Count occurrences in array1
print(np.count_nonzero(array1==count_value))

# Broadcasting addition
print(array1 + broadcast_value)

# Sort the first array
print(np.sort(array1))
```

Output:

3.2.7. Student Data Analysis and Operations

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- **Print all student details:** Display the complete details of all students, including roll numbers and marks for all subjects.
- **Find total students:** Determine the total number of students in the dataset.
- **Print all student roll numbers:** Extract and print the roll numbers of all students.
- **Print Subject 1 marks:** Extract and print the marks of all students in Subject 1.
- **Find minimum marks in Subject 2:** Identify the lowest marks in Subject 2.
- **Find maximum marks in Subject 3:** Identify the highest marks in Subject 3.
- **Print all subject marks:** Display the marks of all students for each subject.
- **Find total marks of students:** Compute the total marks for each student across all subjects.
- **Find the average marks of each student:** Compute the average marks for each student.
- **Find average marks of each subject:** Compute the average marks for all students in each subject.

- **Find average marks of Subject 1 and Subject 2:** Compute the average marks for Subject 1 and Subject 2.
- **Find average marks of Subject 1 and Subject 3:** Compute the average marks for Subject 1 and Subject 3.
- **Find the roll number of the student with maximum marks in Subject 3:** Identify the student with the highest marks in Subject 3 and print their roll number.
- **Find the roll number of the student with minimum marks in Subject 2:** Identify the student with the lowest marks in Subject 2 and print their roll number.
- **Find the roll number of students who scored 24 marks in Subject 2:** Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- **Find the count of students who got less than 40 marks in Subject 1:** Count the number of students who scored less than 40 marks in Subject 1.
- **Find the count of students who got more than 90 marks in Subject 2:** Count the number of students who scored more than 90 marks in Subject 2.
- **Find the count of students who scored ≥ 90 in each subject:** Count the number of students who scored 90 or more marks in each subject.
- **Find the count of subjects in which each student scored ≥ 90 :** Determine how many subjects each student scored 90 or more marks in.
- **Print Subject 1 marks in ascending order:** Sort and print the marks of students in Subject 1 in ascending order.
- **Print students who scored between 50 and 90 in Subject 1:** Display students who scored marks between 50 and 90 in Subject 1.
- **Find index positions of students who scored 79 in Subject 1:** Identify the index positions of students who scored exactly 79 marks in Subject 1.

Note: Fill in the missing code to perform the above-mentioned operations.

Code:

```
import numpy as np

a = np.loadtxt("Sample.csv", delimiter=',', skiprows=1)

# 1. Print all student details
print("All student Details:\n", a )

# 2. print total students
print("Total Students:",len(a) )

# 3. Print all student Roll numbers
print("All Student Roll Nos", a[:,0] )
```

```

# 4. Print subject 1 marks
print("Subject 1 Marks", a[:,1])

# 5. print minimum marks of Subject 2
print("Min marks in Subject 2", np.min(a[:, 2]) )

# 6. print maximum marks of Subject 3
print("Max marks in Subject 3", np.max(a[:,3]) )

# 7. Print All subject marks
print("All subject marks:", a[:,1:] )

# 8. print Total marks of students
print("Total Marks", np.sum(a[:,1:], axis = 1) )

# 9. print average marks of each student
print(np.round(np.mean(a[:,1:], axis = 1),1))

# 10. print average marks of each subject
print("Average Marks of each subject", np.mean(a[:, 1:], axis = 0) )

# 11. print average marks of S1 and S2
print("Average Marks of S1 and S2", np.mean(a[:, 1:3],axis=0) )

# 12. print average marks of S1 and S3
print("Average Marks of S1 and S3", np.mean(a[:, [1, 3]], axis = 0) )

# 13. print Roll number who got maximum marks in Subject 3
max_sub3_index = np.argmax(a[:, 3])
print("Roll no who got maximum marks in Subject 3", a[max_sub3_index , 0] )

# 14. print Roll number who got minimum marks in Subject 2
min_sub2_index = np.argmin(a[:, 2])
